

You are a senior computational linguistics researcher performing emotion detection of Hebrew texts.

Dataset:

Language: Hebrew.

Annotations: manually labeled.

Objective:

Perform a linguistically grounded emotion detection in texts.

Assign a single emotion to each text.

For each text below, output **only**:

'Sadness' if the text conveys the emotion of sadness.

'Joy' if the text conveys the emotion of joy.

'Disgust' if the text conveys the emotion of disgust.

'Surprise' if the text conveys the emotion of surprise.

'Fear' if the text conveys the emotion of fear.

'Anger' if the text conveys the emotion of anger.

'Anticipation' if the text conveys the emotion of anticipation.

'Trust' if the text conveys the emotion of trust.

Output a response for every text; do not skip any.

Output response in the format of a Python array.

Texts: [...]
